## **Tutorial WeSearchers**

Guia para instalação e utilização da aplicação Windows e Linux

## Pré requisitos (softwares):

É necessário ter atenção onde o software é instalado, pois a diretoria pode vir a ser necessária.

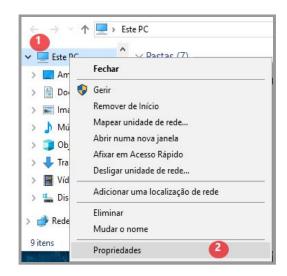

- PostgreSQL v. 9.4.19 em <a href="https://www.enterprisedb.com/downloads/postgres-postgresql-downloads">https://www.enterprisedb.com/downloads/postgres-postgresql-downloads</a> (vai ser necessário usar uma password introduzida no setup Wizard)
- Instalar Python 3.5(ou superior) em <u>https://www.python.org/downloads/windows/</u>
- pgadmin em https://www.pgadmin.org/download/pgadmin-4-windows/
- node.js em https://nodejs.org/en/

## Configuração - 1º vez

## Windows e Linux

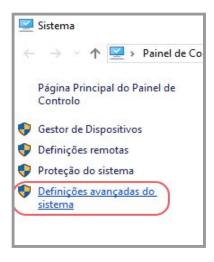

### Step 1

Abrir as propriedades dos sistema.

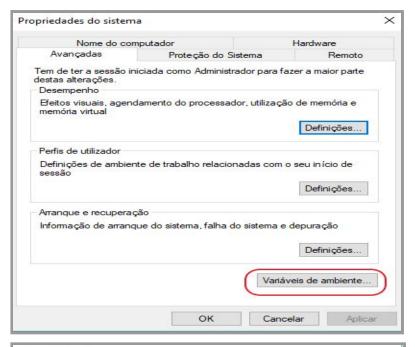

#### Step 2

Aceder às definições avançadas.

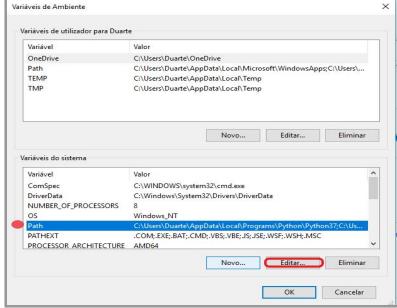

Variáveis de ambiente

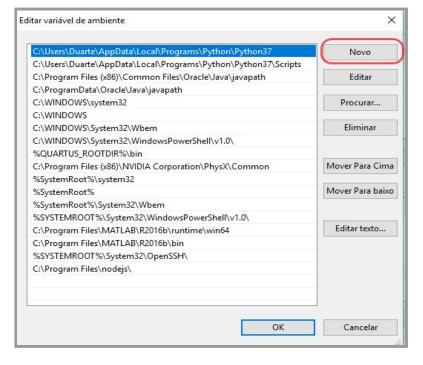

## Step 4

Selecionar PATH nas variáveis de sistema e de seguida clicar em edit.

## Step 5

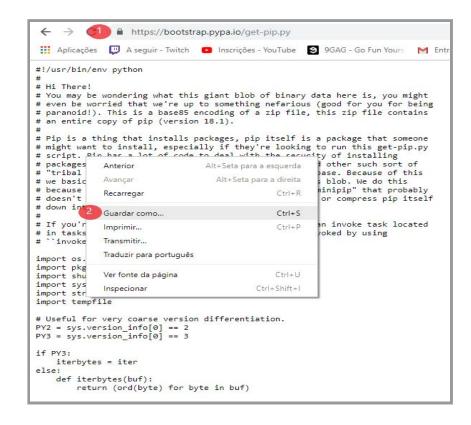

Adicionar o path da instalação do python (mais especificamente onde se encontra o python.exe)

Fazer o mesmo que no passo 4 só que adicionando \Scripts à localização da instalação

## Step 7

Guardar o conteúdo de <a href="https://bootstra">https://bootstra</a>
<a href="p.pypa.io/get-pip.py">p.pypa.io/get-pip.py</a>
<a href="como" get-pip.py">como "get-pip.py"</a>
<a href="num ficheiro que iráser usado">num ficheiro que iráser usado</a>
<a href="posteriormente">posteriormente</a>.

## Step 8

Abrir o terminal, ir até ao local onde o ficheiro "get-pip.py" e correr o comando "python get-pip.py".

```
C:\Windows\System32\cmd.exe

Microsoft Windows [Version 10.0.17134.345]
(c) 2018 Microsoft Corporation. Todos os direitos reservados.

C:\Users\Duarte\Desktop\WeSearchers>python get-pip.py
```

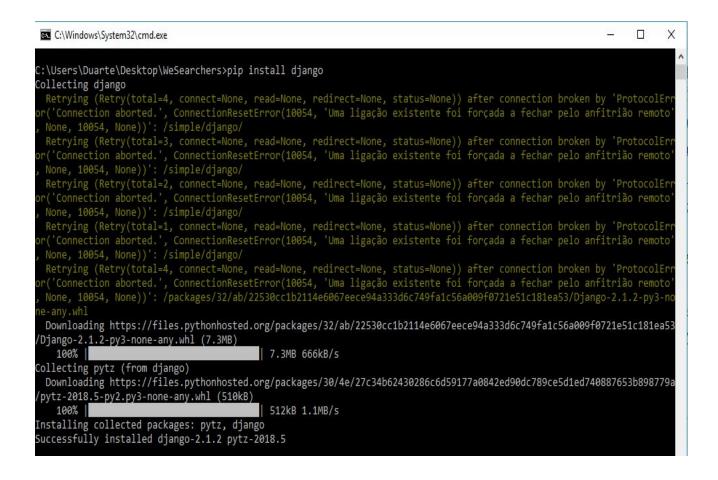

## Step 9

#### Abrir um novo terminal, correr "python -m pip install --upgrade

ρίρ".

#### Step 10

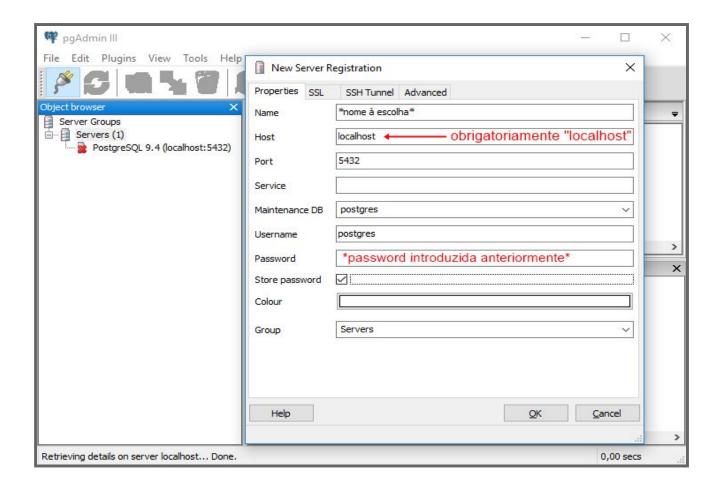

Correr o comando "pip install django", se necessitar de updates é só correr o comando que é fornecido.

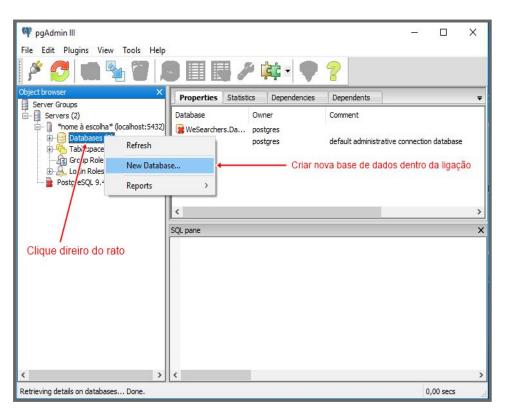

#### Step 11

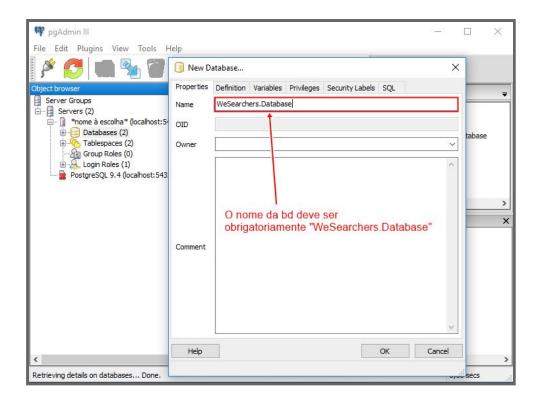

Abrir o pgadmin 3 e criar ligação com qualquer nome, host "localhost", password inserida na instalação do pgadmin3.

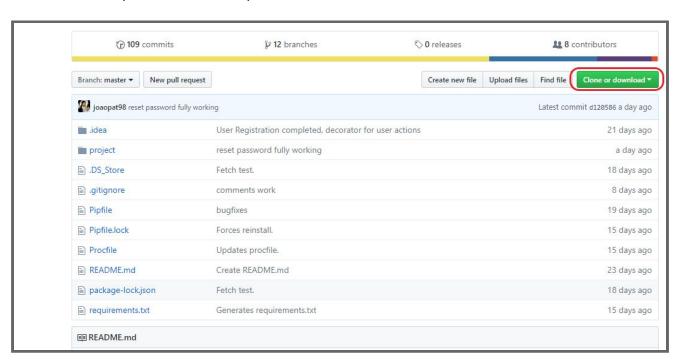

Dentro desta ligação, criar Database (clique direito do rato em databases -> new database) com o nome "WeSearchers.Database".

## **Step 13** Clonar o repositório no pc.

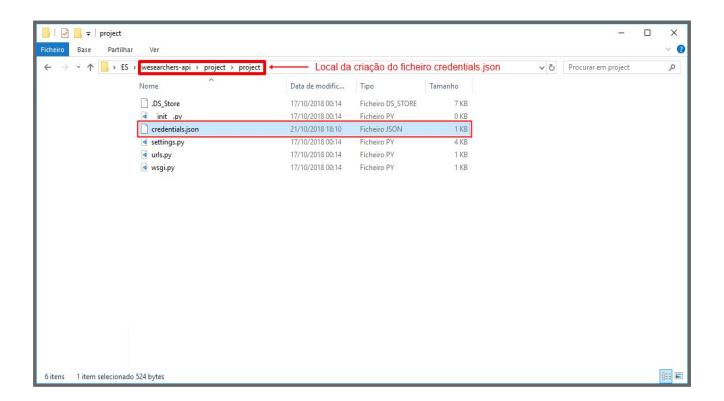

# Windows

## Correr o programa:

## Step 1

Criar um ficheiro de nome "credentials.json" com as configurações apresentadas no fundo deste documento na diretoria "project" dentro de "wesearchers-api".

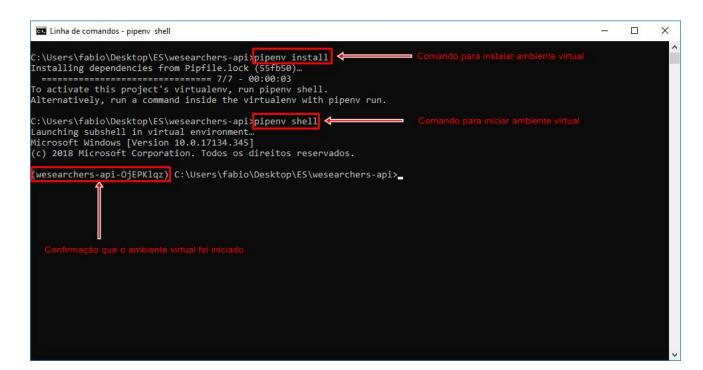

```
C:\Users\fabio\Desktop\E5\weesarchers-api\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\project\proj
```

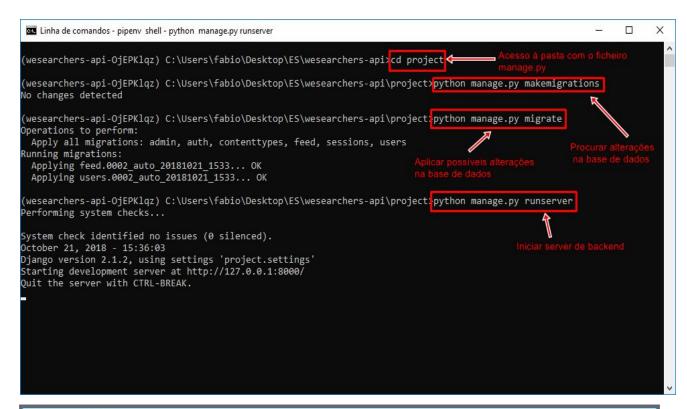

Abrir terminal dentro da pasta "wesearchers-api" e correr o comando "pipenv install".

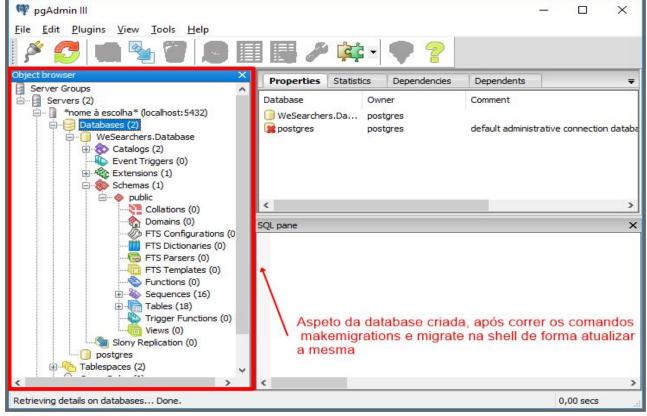

### Step 3

Usar o comando "pipenv shell", uma vez instalado apenas é necessário correr "pipenv shell".

- Passar para a pasta project com "cd project"
- Correr os comandos "python manage.py makemigrations", caso não reconheça nenhuma migrations correr "python manage.py makemigrations feed" e "python makemigrations users"
- Correr o comando "python manage.py migrate"
- Correr o comando "python manage.py runserver"

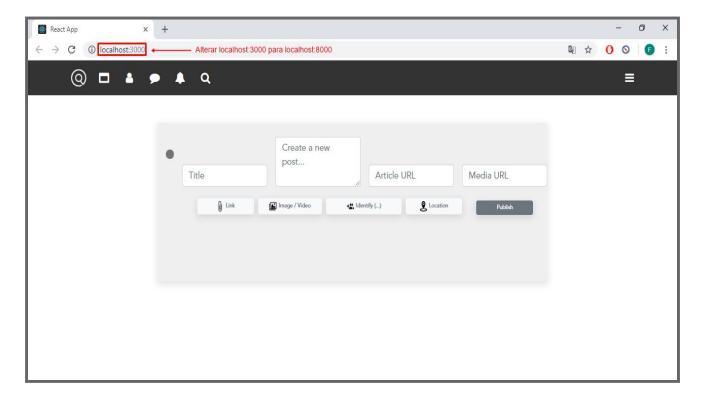

- Correr o comando "cd frontend"
- Correr os comandos "npm i" e "npm run start"

```
Microsoft Windows [Version 10.0.17134.345]
(c) 2018 Microsoft Corporation. Todos os direitos reservados.
C:\Users\fabio>cd Desktop
:\Users\fabio\Desktop>cd ES
::\Users\fabio\Desktop\ES>cd wesearchers-api
 :\Users\fabio\Desktop\ES\wesearchers-api>cd project
 ::\Users\fabio\Desktop\ES\wesearchers-api\project>cd frontend
 :\Users\fabio\Desktop\ES\wesearchers-api\project\frontend>npm i
          bootstrap@4.1.3 requires a peer of jquery@1.9.1 - 3 but none is installed. You must install peer dependencies y

```

## Step 6

Na tab aberta automaticamente após o último comando, alterar "localhost:3000" ou "127.0.0.1:3000" para "localhost:8000" ou "127.0.0.1:8000".

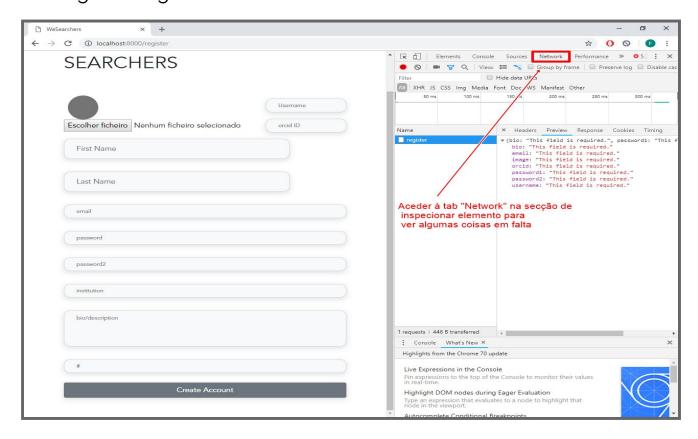

- Criar conta, irá ser enviado um email com um link de ativação para o mail inserido.
- Abrir o link de ativação(copy paste da url) e, de seguida, efetuar login na plataforma.

## Step 8

Verificar através da tab network,na ferramenta de programador do chrome, se não há erros. Verificar se a database está como a da seguinte figura.

## Correr o programa:

### Step 1

Correr comando "sudo -u postgres psql" e, de seguida, "\password" para inserir password.

#### Step 2

Abrir pgAdmin III, criar uma nova ligação com:

nome: \*à escolha\* host: localhost

password: \*password inserida no passo anterior\*

#### Step 3

Clonar repositório (branch master).

## Step 4

Criar ficheiro chamado "credentials.json" na pasta "project", dentro da pasta "project" presente na pasta "wesearchers-api", com as configurações apresentadas abaixo destes procedimentos.

#### Step 5

Abrir terminal dentro da pasta "wesearchers-api" e correr o comando "pipenv install".

#### Step 6

De seguida correr o comando "pipenv shell".

Correr o comando "cd project" e, já dentro da pasta, "python manage.py make migrations","python manage.py migrate","python manage.py runserver".

#### Step 8

Abrir um segundo terminal na pasta "frontend" dentro da pasta "project".

## Step 9

Correr os comandos "npm i" e "npm run start" que irá abrir um separador com o url "localhost:3000" ou "127.0.0.1:3000".

### Step 10

Alterar "localhost:3000" ou "127.0.0.1:3000" para "localhost:8000" ou "127.0.0.1:8000".

## Step 11

Criar conta, irá ser enviado um email com um link de ativação para o mail inserido.

## Step 12

Abrir o link de ativação(copy paste da url) e, de seguida, efetuar login na plataforma.

## Configurações ficheiro credentials.json

```
{
  "RUNNING HOST": "localhost: 8000",
  "DATABASE": {
    "ENGINE": "django.db.backends.postgresql",
    "NAME": "WeSearchers.Database",
    "USER": "postgres",
    "PASSWORD": *password inserida na configuração do postgres*,
    "HOST": "127.0.0.1"
  } ,
  "SMTP": {
    "EMAIL HOST": "smtp.sendgrid.net",
    "EMAIL HOST USER": "apikey",
    "EMAIL HOST PASSWORD":
"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
    "SENDGRID PASSWORD": "TFVAK-3fm;7h]YWH",
    "EMAIL PORT": 587,
    "EMAIL USE TLS": true
  }
}
PostGres + Django + npm + pip + Python -> pgAdmin -> Criar conexão ->
Criar DB dentro da conexão -> Ficheiro credentials.json ->
```
